- Effective Light Dynamics in Perturbed Photonic Crystals Comm. Math. Phys. **332**, issue 1, pp. 221--260, 2014
- Derivation of Ray Optics Equations in Photonic Crystals Via a Semiclassical Limit
 Derivation 2015

arxiv:1502.07235, submitted for publication, 2015

Long-Term Goal

Effective Models

Long-Term Goal

Understand how topological effects emerge from electrodynamics,

starting from Maxwells equations.

▲□▶▲□▶▲≡▶▲≡▶ ≡ のへで

Part 1 Photonic Crystals

Part 2 Photonic Topological Insulators

Part 3 Effective Models

<ロト < 団 > < 三 > < 三 > < 三 > < 三 > < ○ < ○</p>

Part 1 Photonic Crystals

Photonic Cyrstals

Johnson & Joannopoulos (2004)

Assumption (Material weights)

$$W(\mathbf{x}) = \begin{pmatrix} \varepsilon(\mathbf{x}) & \chi(\mathbf{x}) \\ \chi(\mathbf{x})^* & \mu(\mathbf{x}) \end{pmatrix}$$

2
$$W^* = W$$
 (lossless)

3 W frequency-independent (response instantaneous)

④ W periodic wrt lattice
$$\Gamma\simeq\mathbb{Z}^3$$

Photonic Cyrstals

Johnson & Joannopoulos (2004)

Maxwell equations Dynamical equations $\begin{pmatrix} \varepsilon & \chi \\ \chi^* & \mu \end{pmatrix} \frac{\partial}{\partial t} \begin{pmatrix} \mathbf{E} \\ \mathbf{H} \end{pmatrix} = \begin{pmatrix} -\nabla_x \times \mathbf{H} \\ +\nabla_x \times \mathbf{E} \end{pmatrix}$

Absence of sources

$$\begin{pmatrix} \mathsf{div} & 0 \\ 0 & \mathsf{div} \end{pmatrix} \begin{pmatrix} \varepsilon & \chi \\ \chi^* & \mu \end{pmatrix} \begin{pmatrix} \mathbf{E} \\ \mathbf{H} \end{pmatrix} = 0$$

うしん 川 エキャイド・ 一日・

Symmetries of Ordinary Materials

$$W = \begin{pmatrix} \varepsilon & 0 \\ 0 & \mu \end{pmatrix} = \begin{pmatrix} \operatorname{Re} \varepsilon & 0 \\ 0 & \operatorname{Re} \mu \end{pmatrix}, \qquad \varepsilon \not\propto \mu$$

- **1** $C: (\mathbf{E}, \mathbf{H}) \mapsto (\overline{\mathbf{E}}, \overline{\mathbf{H}})$ complex conjugation relies on $\varepsilon, \mu, \chi \in \mathbb{R}$, "real fields remain real"
- 2 $T: (\mathbf{E}, \mathbf{H}) \mapsto (\mathbf{E}, -\mathbf{H})$ implements time-reversal relies on $\chi = 0$
- 3 $J = TC : (\mathbf{E}, \mathbf{H}) \mapsto (\mathbf{\overline{E}}, -\mathbf{\overline{H}})$ implements time-reversal

うしん 川 エキャイド・ 一日・

Symmetries of Ordinary Materials

$$W = \begin{pmatrix} \varepsilon & 0 \\ 0 & \mu \end{pmatrix} = \begin{pmatrix} \operatorname{Re} \varepsilon & 0 \\ 0 & \operatorname{Re} \mu \end{pmatrix}, \qquad \varepsilon \not\propto \mu$$

- ② $T: (\mathbf{E}, \mathbf{H}) \mapsto (\mathbf{E}, -\mathbf{H})$ implements time-reversal relies on $\chi = 0$
- 3 $J = TC : (\mathbf{E}, \mathbf{H}) \mapsto (\overline{\mathbf{E}}, -\overline{\mathbf{H}})$ implements time-reversal

Symmetries of Ordinary Materials

$$W = \begin{pmatrix} \varepsilon & 0 \\ 0 & \mu \end{pmatrix} = \begin{pmatrix} \operatorname{\mathsf{Re}} \varepsilon & 0 \\ 0 & \operatorname{\mathsf{Re}} \mu \end{pmatrix}, \qquad \varepsilon \not\propto \mu$$

Classification of Topological Insulators in QM

Cartan-Altland-Zirnbauer classification scheme

Classifies according to discrete symmetries

• 3 types of (pseudo) symmetries: U unitary/antiunitary, $U^2 = \pm id$,

- 10 CAZ classes
- Relies on $i\partial_t \psi = H\psi$ (Schrödinger equation)

J = TC	JM(k)J = +M(-k)	+TR	implements time-reversal

⇒ Ordinary PhCs are of class BDI

CAZ Classification of Ordinary PhCs

Symmetry	Action	Classified as	Physical meaning
С	CM(k)C = -M(-k)	+PH	"real states remain real"
$T = \sigma_3 \otimes id$	TM(k)T = -M(+k)	X	implements time-reversal
J=TC	JM(k)J = +M(-k)	+TR	implements time-reversal

 \Rightarrow Ordinary PhCs are of class BDI

Comparison Between Photonics and Quantum Mechanics

Material	Photonics	Quantum mechanics
ordinary	class BDI +PH, +TR, χ	class AI +TR
exhibiting edge currents	class Alll χ	class A/All none/-TR

Important consequences

- Class BDI not topologically trivial (also relevant in theory of topological superconductors)
- Existing derivations of topological effects in crystalline solids do not automatically apply to photonic crystals

Comparison Between Photonics and Quantum Mechanics

÷.

- Existing derivations of topological effects in crystalline solids **do not automatically apply** to photonic crystals

Part 3 Effective Models

Effective Tight-Binding Models

Goal: Find

- In orthogonal projection Π and
- a simpler effective operator M_{eff} (equivalent to a tight-binding operator)

so that for states from ran Π we have

$$e^{-itM} \Pi = e^{-itM_{eff}} \Pi + error.$$

Effective Models Should Retain All Symmetries!

For topological effects: M and M_{eff} which enter

 $e^{-it \mathcal{M}} \, \Pi = e^{-it \mathcal{M}_{eff}} \, \Pi + \text{error}$

should be in the same CAZ class

- *M* and *M*_{eff} possess the same number and type of symmetries
- Due to misclassification of PhCs in earlier works: **disregarded** in the literature

Effective Models Should Retain All Symmetries!

For topological effects: M and M_{eff} which enter

$$e^{-itM} \Pi = e^{-itM_{eff}} \Pi + error$$

should be in the same CAZ class

Existence of Physical States

Theorem (De Nittis-L. 2014 (CMP))

Suppose the bands $\sigma_{rel}(k) = \sigma_{rel}(-k)$ are isolated and $0 \notin \sigma_{rel}(0)$. Then there exist orthogonal projections

$$\Pi_{\lambda} = \Pi_{+,\lambda} + \Pi_{-,\lambda} + \mathcal{O}(\lambda^{\infty})$$

so that

$$[M_{\lambda}, \Pi_{\pm,\lambda}] = \mathcal{O}(\lambda^{\infty})$$

whose range supports physical states.

Effective Light Dynamics

Theorem (PhCs of class BDI, De Nittis-L. 2014 (CMP))

Suppose the bands $\sigma_{rel}(k) = \sigma_{rel}(-k)$ are isolated and $0 \notin \sigma_{rel}(0)$. Then there exist a unitary V_{λ} and an effective Maxwell operator

$$M_{\mathsf{eff}} = V_{\lambda}^{-1} \, \mathcal{M}_{\mathsf{eff}} ig(\mathsf{i} \lambda
abla_k, \hat{k} ig) \, V_{\lambda}$$

which approximates the full light dynamics,

$$\mathbf{e}^{-\mathbf{i}t\mathcal{M}_{\lambda}}\Pi_{\lambda} = \mathbf{e}^{-\mathbf{i}t\mathcal{M}_{\text{eff}}}\Pi_{\lambda} + \mathcal{O}(\lambda^{\infty}),$$
$$\mathbf{e}^{-\mathbf{i}t\mathcal{M}_{\lambda}}\Pi_{\lambda}\operatorname{Re} = \operatorname{Re} \,\mathbf{e}^{-\mathbf{i}t\mathcal{M}_{\text{eff}}}\Pi_{\lambda}\operatorname{Re} + \mathcal{O}(\lambda^{\infty}).$$

and leaves ran Π_{λ} invariant up to $\mathcal{O}(\lambda^{\infty})$.

 Π_{λ} , V_{λ} and $\mathcal{M}_{\mathsf{eff}}$ can be computed explicitly order-by-order in λ

◆□▶ ◆□▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ● ● ● ●

Effective Light Dynamics

Theorem (PhCs of class D and AI, De Nittis-L. 2014 (CMP)) Similarly, we can derive effective effective dynamics of the form

$$\mathsf{e}^{-\mathsf{i}t\mathcal{M}_{\lambda}}\,\Pi_{\lambda}=\mathsf{e}^{-\mathsf{i}t\mathcal{M}_{\mathsf{eff}}}\,\Pi_{\lambda}+\mathcal{O}(\lambda^{\infty})$$

if M_{λ} has only C-symmetry (class D) or only J = TC-symmetry (class Al).
Proof.

• Crucial technical tool: **pseudodifferential calculus**

• Projection onto almost-invariant subspace:

$$\Pi_{\lambda} = \pi_{\lambda} \left(\mathsf{i} \lambda \nabla_k, \hat{k} \right) + \mathcal{O}(\lambda^{\infty})$$

• Unitary:
$$V_{\lambda} = U_{aux} U_{\lambda}$$
 where

$$U_{\lambda} = u_{\lambda} \big(i \lambda \nabla_k, \hat{k} \big) + \mathcal{O}(\lambda^{\infty})$$

• 4 defining relations:

$$\pi_{\lambda} \sharp \pi_{\lambda} = \pi_{\lambda} + \mathcal{O}(\lambda^{\infty})$$
$$u_{\lambda} \sharp u_{\lambda}^{*} = 1 + \mathcal{O}(\lambda^{\infty})$$

$$\begin{split} \left[\mathcal{M}_{\lambda}\,,\,\pi_{\lambda}\right]_{\sharp} &= \mathcal{O}(\lambda^{\infty})\\ u_{\lambda}\sharp\pi_{\lambda}\sharp u_{\lambda}^{*} &= \pi_{\mathsf{ref}} + \mathcal{O}(\lambda^{\infty}) \end{split}$$

$$\pi_{\lambda} \sharp \pi_{\lambda} = \pi_{\lambda} + \mathcal{O}(\lambda^{\infty}) \qquad \left[\mathcal{M}_{\lambda}, \pi_{\lambda}\right]_{\sharp} = \mathcal{O}(\lambda^{\infty})$$
$$u_{\lambda} \sharp u_{\lambda}^{*} = 1 + \mathcal{O}(\lambda^{\infty}) \qquad u_{\lambda} \sharp \pi_{\lambda} \sharp u_{\lambda}^{*} = \pi_{\mathsf{ref}} + \mathcal{O}(\lambda^{\infty})$$

▲□▶▲□▶▲≡▶▲≡▶ ≡ のへ⊙

Proof.

- Crucial technical tool: **pseudodifferential calculus**
- Projection onto almost-invariant subspace:

$$\Pi_{\lambda} = \pi_{\lambda} \left(\mathsf{i} \lambda \nabla_{k}, \hat{k} \right) + \mathcal{O}(\lambda^{\infty})$$

• Unitary:
$$V_{\lambda} = U_{\mathsf{aux}} U_{\lambda}$$
 where

$$U_{\lambda} = u_{\lambda} \big(i \lambda \nabla_k, \hat{k} \big) + \mathcal{O}(\lambda^{\infty})$$

• 4 defining relations:

$$\pi_{\lambda} \sharp \pi_{\lambda} = \pi_{\lambda} + \mathcal{O}(\lambda^{\infty}) \qquad \begin{bmatrix} \mathcal{M}_{\lambda} \, , \, \pi_{\lambda} \end{bmatrix}_{\sharp} = \mathcal{O}(\lambda^{\infty}) \\ u_{\lambda} \sharp u_{\lambda}^{*} = 1 + \mathcal{O}(\lambda^{\infty}) \qquad u_{\lambda} \sharp \pi_{\lambda} \sharp u_{\lambda}^{*} = \pi_{\mathsf{ref}} + \mathcal{O}(\lambda^{\infty}) \end{cases}$$

Ingredients to the proof

Proof.

Construction of Moyal unitary $u_{\lambda} = \sum_{n=0}^{\infty} \lambda^n u_n$

 Existence of u₀ relies on triviality of the Bloch bundle (⇔ Chern numbers 0)

$$\mathcal{E}_{\mathsf{Bloch}} = \left(\bigsqcup_{k \in \mathbb{R}^3} \operatorname{ran} \pi_0(k)\right) / \Gamma^*$$

• $u_n, n \ge 1$, can be computed recursively and explicitly from $\{u_j\}_{0 \le j \le n-1}$ and $\{\pi_j\}_{0 \le j \le n}$

Covered in the talk today

Part 2

Classification of photonic topological insulators

- Schrödinger formalism of electromagnetism

 application of CAZ scheme for TIs
- Complete classification table in publication
- Ordinary material in class BDI (3 symmetries)
 - → different from time-reversal-invariant quantum systems!
 - → each symmetry can be broken individually

Part 3 **Effective light dynamic**

- For topological effects: *M* and *M*_{eff} of same CAZ class
- So far: effective dynamics for PTIs of classes BDI, D and AI
- Explicit form of $\mathcal{O}(\lambda)$ corrections available
- Ray optics equations also available
